### REC\_DS using C\_Week 2\_COD\_Question 5

Attempt : 1

Total Mark : 10

Marks Obtained : 10

### **Section 1 : Coding**

#### **1. Problem Statement**

Ashwin is tasked with developing a simple application to manage a list of items in a shop inventory using a doubly linked list. Each item in the inventory has a unique identification number. The application should allow users to perform the following operations:

Create a List of Items: Initialize the inventory with a given number of items. Each item will be assigned a unique number provided by the user and insert the elements at end of the list.

Delete an Item: Remove an item from the inventory at a specific position.

Display the Inventory: Show the list of items before and after deletion.

If the position provided for deletion is invalid (e.g., out of range), it should

display an error message.

### ***Input Format***

The first line contains an integer  $n$ , representing the number of items to be initially entered into the inventory.

The second line contains  $n$  integers, each representing the unique identification number of an item separated by spaces.

The third line contains an integer  $p$ , representing the position of the item to be deleted from the inventory.

### ***Output Format***

The first line of output prints "Data entered in the list:" followed by the data values of each node in the doubly linked list before deletion.

If  $p$  is an invalid position, the output prints "Invalid position. Try again."

If  $p$  is a valid position, the output prints "After deletion the new list:" followed by the data values of each node in the doubly linked list after deletion.

Refer to the sample output for the formatting specifications.

### ***Sample Test Case***

Input: 4

1 2 3 4

5

Output: Data entered in the list:

node 1 : 1

node 2 : 2

node 3 : 3

node 4 : 4

Invalid position. Try again.

### ***Answer***

```
// You are using GCC
```

```
#include<stdio.h>
```

```
#include<stdlib.h>
```

```

struct info{
    int data;
    struct info* prev;
    struct info* next;
};
struct info* create( int data){
    struct info* node=(struct info*)malloc(sizeof(struct info));
    node->data=data;
    node->next=node->prev=NULL;
    return node;
}
void print(struct info* head){
    int count=1;
    while(head){
        printf("node %d : %d\n",count++,head->data);
        head=head->next;
    }
}
void clear(struct info** head,int p){
    if(*head == NULL|| p<=0){
        printf("Invalid position. Try again.\n");
        return;
    }
    struct info* temp= *head;
    int count=1;
    while(temp && count < p){
        temp=temp->next;
        count++;
    }
    if(!temp){
        printf("Invalid position. Try again.\n");
        return;
    }
    if(temp->prev)temp->prev->next=temp->next;
    else*head=temp->next;
    if(temp->next)temp->next->prev=temp->prev;
    free(temp);
    printf("After deletion the new list:\n");
    print(*head);
}
int main(){
    int n,p,value;

```

```
struct info* head=NULL,*tail=NULL;
scanf("%d",&n);
for(int i=0;i<n;i++){
    scanf("%d",&value);
    struct info* node=create(value);
    if(!head)head=tail=node;
    else{
        tail->next=node;
        node->prev=tail;
        tail=node;
    }
}
scanf("%d",&p);
printf("Data entered in the list:\n");
print(head);
clear(&head,p);
return 0;
}
```

**Status :** Correct

**Marks :** 10/10
